

Use Case diagram creation

Objective:

Create a sample use-case diagram for a library management system.

Steps to Perform

① Identify Actions:-

- Think about the people or systems interacting with the Library Management System.

• Example Actions:-

- Librarians (Manage books and users accounts)
- Members (borrows and returns books)

② Define Use Cases (functionalities)

→ List out what major tasks or services system provide those actions,

- Example Use Cases
- Search catalog - Members searches for books.
- Check out book - member borrows a book
- Return book - member returns a borrowed book
- Manage Inventory - Librarian updates book records, add remove books.

③ Draw the use-case diagram.

- Place actions on either side of your drawing (stick figures on simple icons)
- Draw ovals (orals) to represent each use case (the system action).
- Connect each actions to the use cases they interact with using straight lines.

- (optional) Add the system boundary box if you want to show that the use cases belong to the system.

④ Review for completeness

- Double-check that every major user action is captured.
- Ensure connections are logical and clean - no action should be left isolated.
